EXECUTIVE SUMMARY

Customer Engagement & Product Utilization Analytics for Retention Strategy

Purpose. Identify behavioral signals associated with churn and recommend targeted, measurable retention actions.

Headline KPI	Observed result
Customers	10,000
Overall churn	20.4%
Active customer churn	14.3%
Inactive customer churn	26.9%
One-product churn	27.7%
Two-product churn	7.6%
Inactive high-balance segment	1,247 customers; churn 30.5%

Recommended decisions

• Prioritize inactive high-balance customers for personalized service reviews.

• Re-engage inactive single-product customers; cross-sell only where needs and suitability support it.

• Test interventions against a holdout group and track incremental retention, complaints and cost.

• Enrich future data with transaction recency/frequency, digital logins, product type and service interactions.

Important caveat

This is a descriptive one-year snapshot. Balance currency is not specified in the supplied file. The dataset has product counts but no product-type mix or actual usage events. Associations are not causal; the relationship score is a heuristic, not a validated predictive model. Apply privacy, fairness and product-suitability controls.
